

Teaching Complexity In Virtual Space

Ruth Fruland
Amlan Mukherjee

Agenda

- Learning Theory
- Complex Domains
- HITL Contributions
 - Virtual Coach
 - Virtual Puget Sound
 - Protein Book
- Future Directions

Tradition

De-contextualizes knowledge

Separates into disciplines

Results: Inability to apply “learning” to relevant situations.
It seems efficient, but if it is not effective, is it *really* efficient?

Reversing Tradition

- Make Unit of Knowledge a “System”
- Make Learning require Activity
- Make Knowledge Problematic
- Cross discipline boundaries (as needed)
- Provide Context (system or context of system)
- Situate in a “real world” scenario

Fast Forward

- Situated Contextualized Learning
 - Embedded in the environment
 - Physical Embodiment
- Adaptation
 - Student and environment:
 - coupled system
 - self-organizing
 - dynamically evolving

What would you learn if you could...

- Control time  speed it up or slow it down
- Control scale  expand or shrink objects & space
- Go anywhere  without effort
- Do any experiment  without harming anything
- Take any risk  without fear of failure
- Ignore cost  without fear of going broke or losing your job?

Strategic Thinking

For Decisions:

- Evaluate Long Term Consequences

For Actions:

- Consider 2nd order consequences

For the Future:

- Look for early signs of problems

Metacognitive Skills

For Complex Systems:

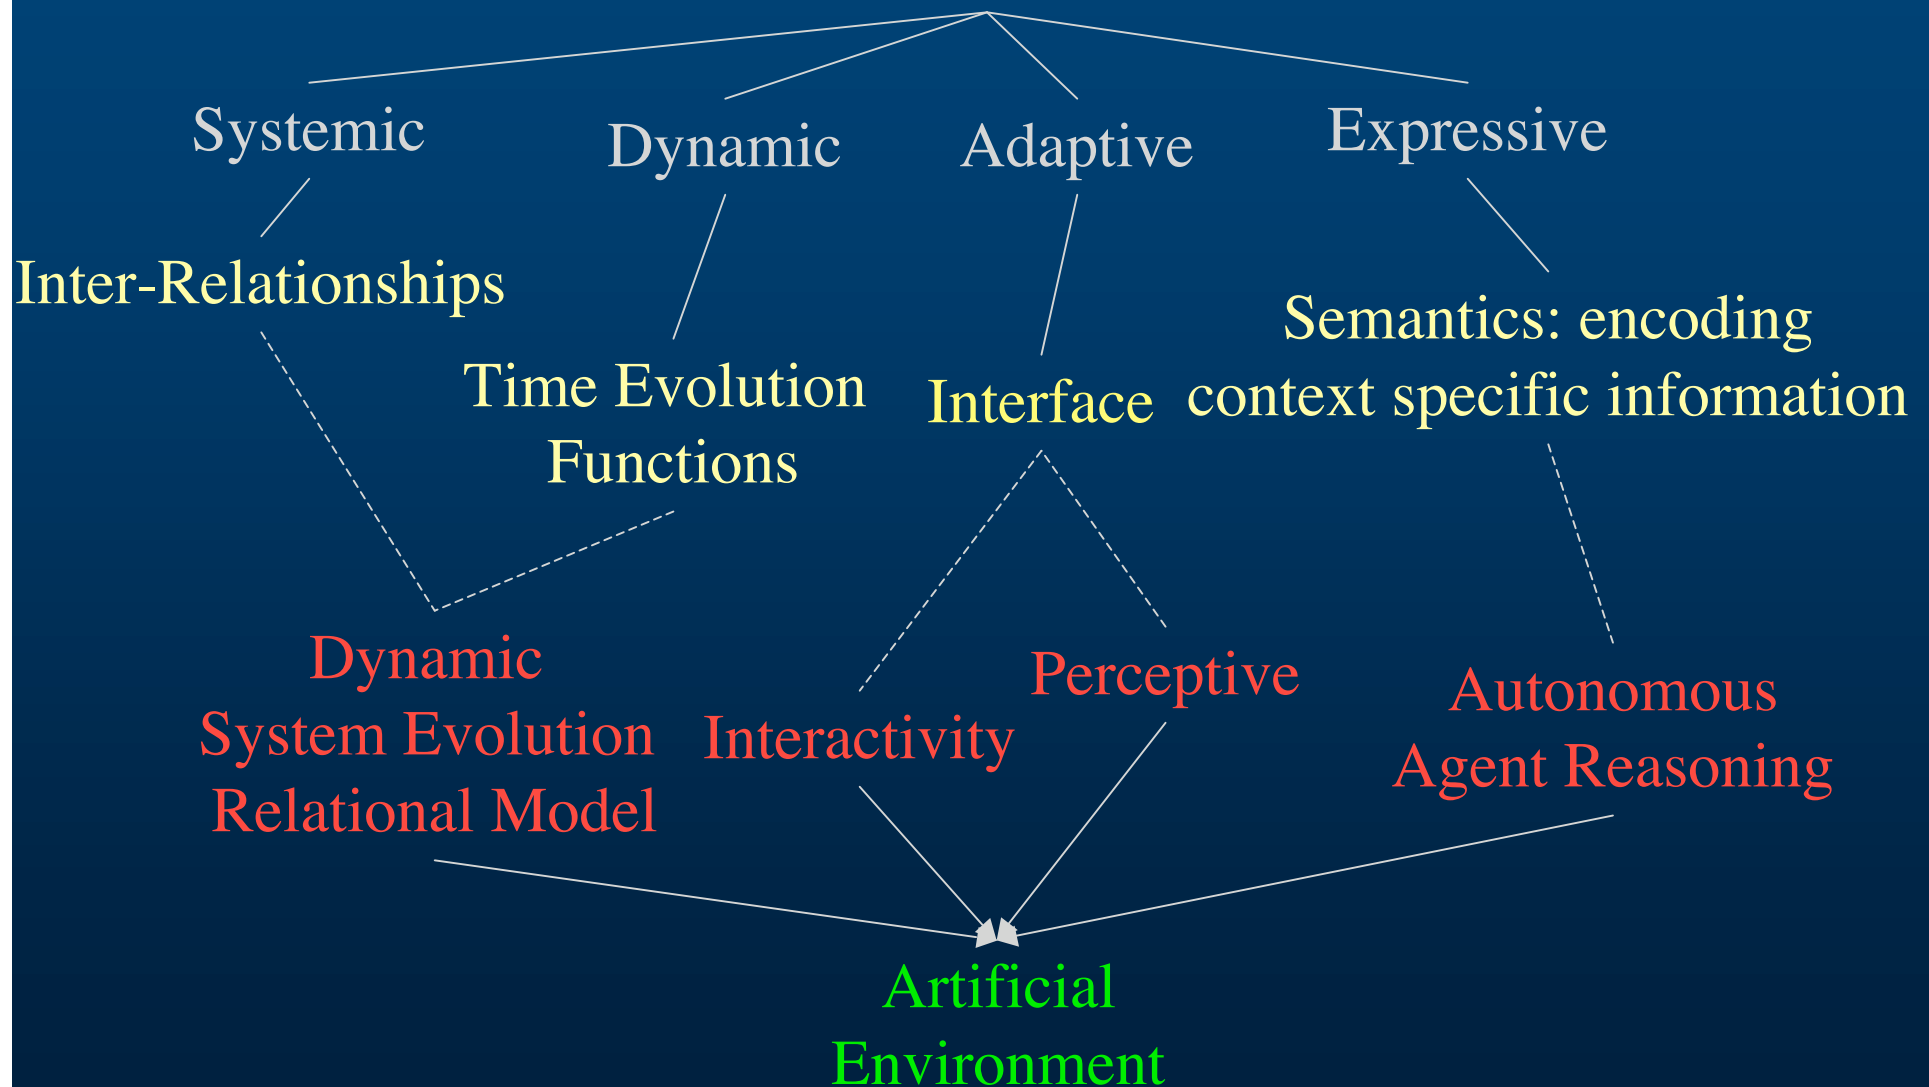

- See the whole and the parts
- Look for relationships and interdependencies
- Look for multiple causes and effects
- Use circular or closed-loop thinking

Challenge

Models

A Narrative

System Evolution:
Relational Model

Scientific
Visualization

Knowledge Base
Rule Base

Simulation Backend:
Dynamic context sensitive
scenario generation

Situational
Simulation

Deductive Reasoning

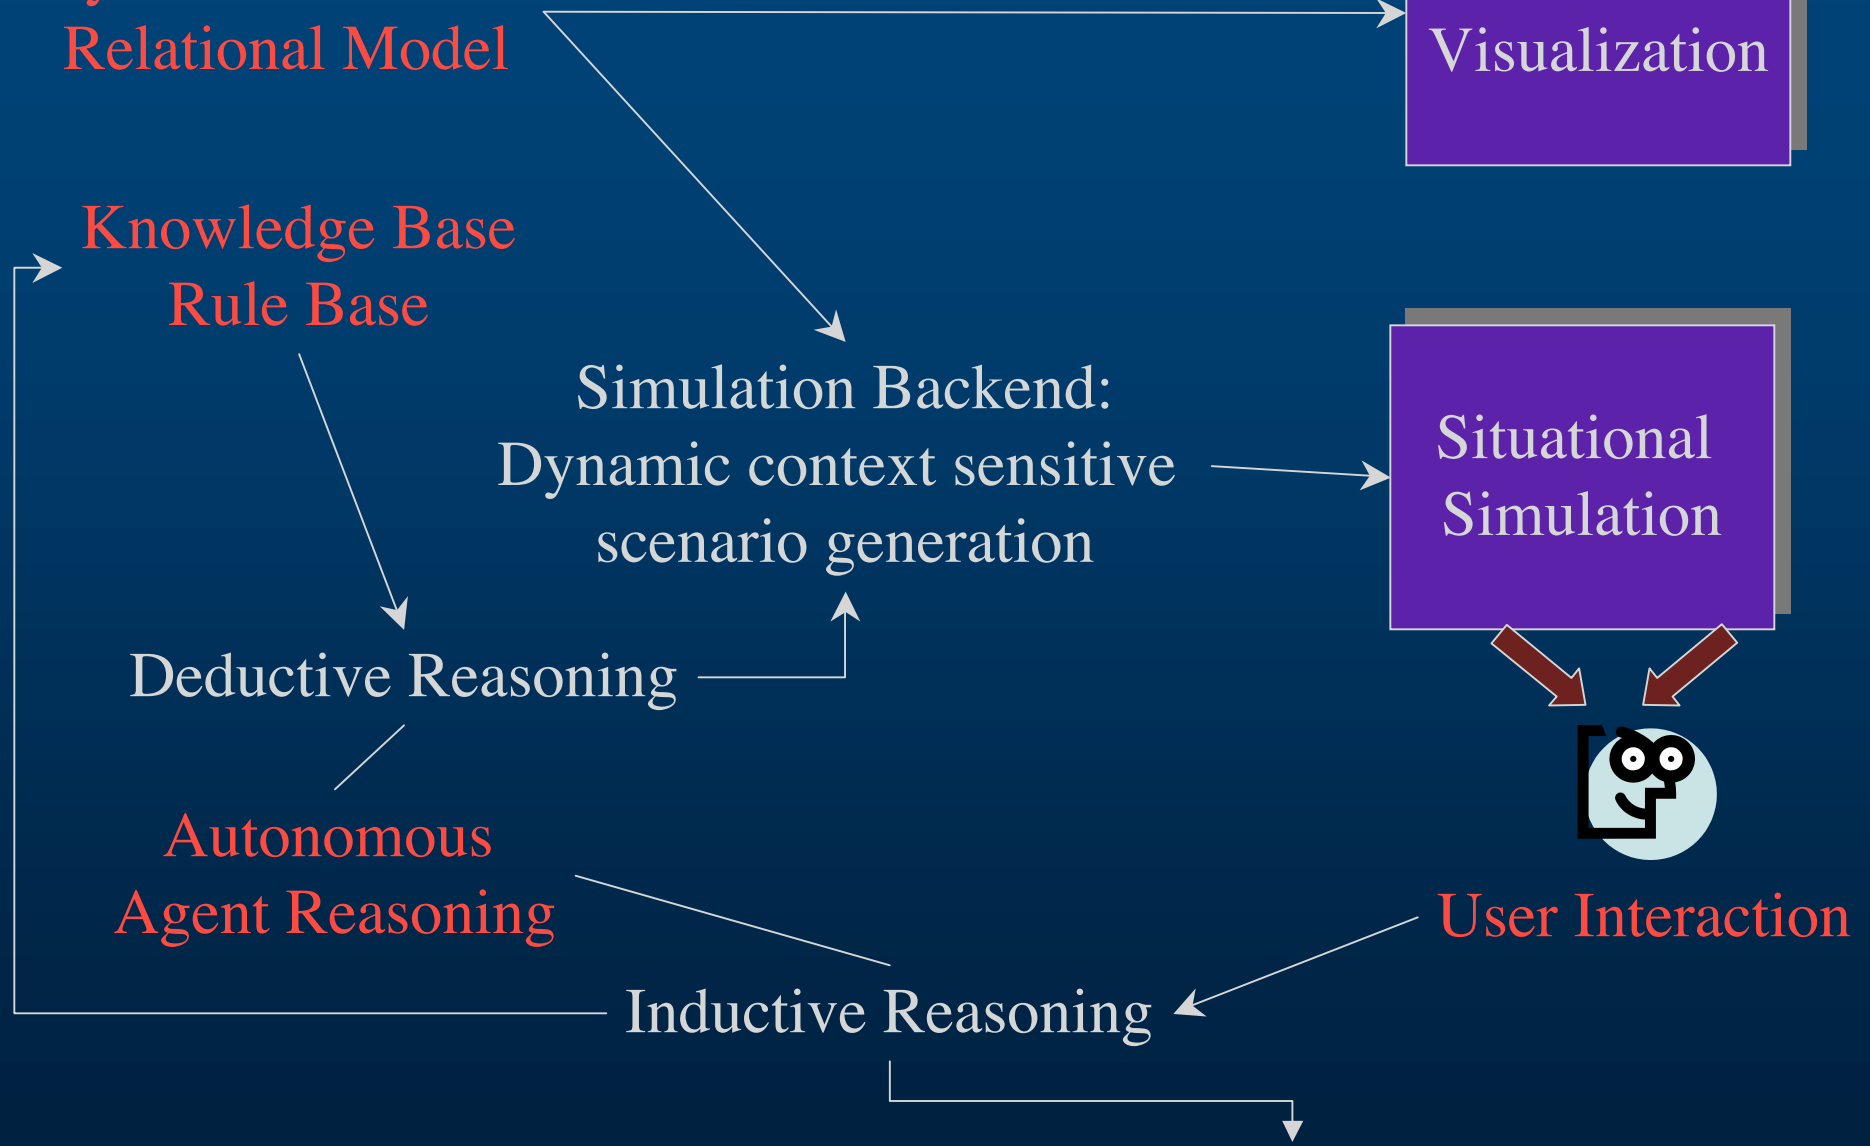

Autonomous
Agent Reasoning

User Interaction

Inductive Reasoning

Meta-Cognitive Knowledge Generation

Complex Domains

```
graph TD; Root[Complex Domains] --> Macro[Macro]; Root --> Micro[Micro]; Root --> Socio[Socio]; Macro --> VP[Virtual Puget Sound]; VP --> VP_List["•VR Environments<br>•Scientific Visualization<br>•Interactive"]; Micro --> MB[Magic Book]; MB --> MB_List["•AR Environments<br>•Scientific Visualization<br>•Interactive"]; Socio --> CM[Construction Management]; CM --> CM_List["•Desktop Situational Simulations<br>•Autonomous Agent Driven (Deductive Reasoning)<br>•System Dynamic Model<br>•Interactive"];
```

Macro

Virtual Puget Sound

- VR Environments
- Scientific Visualization
- Interactive

Micro

Magic Book

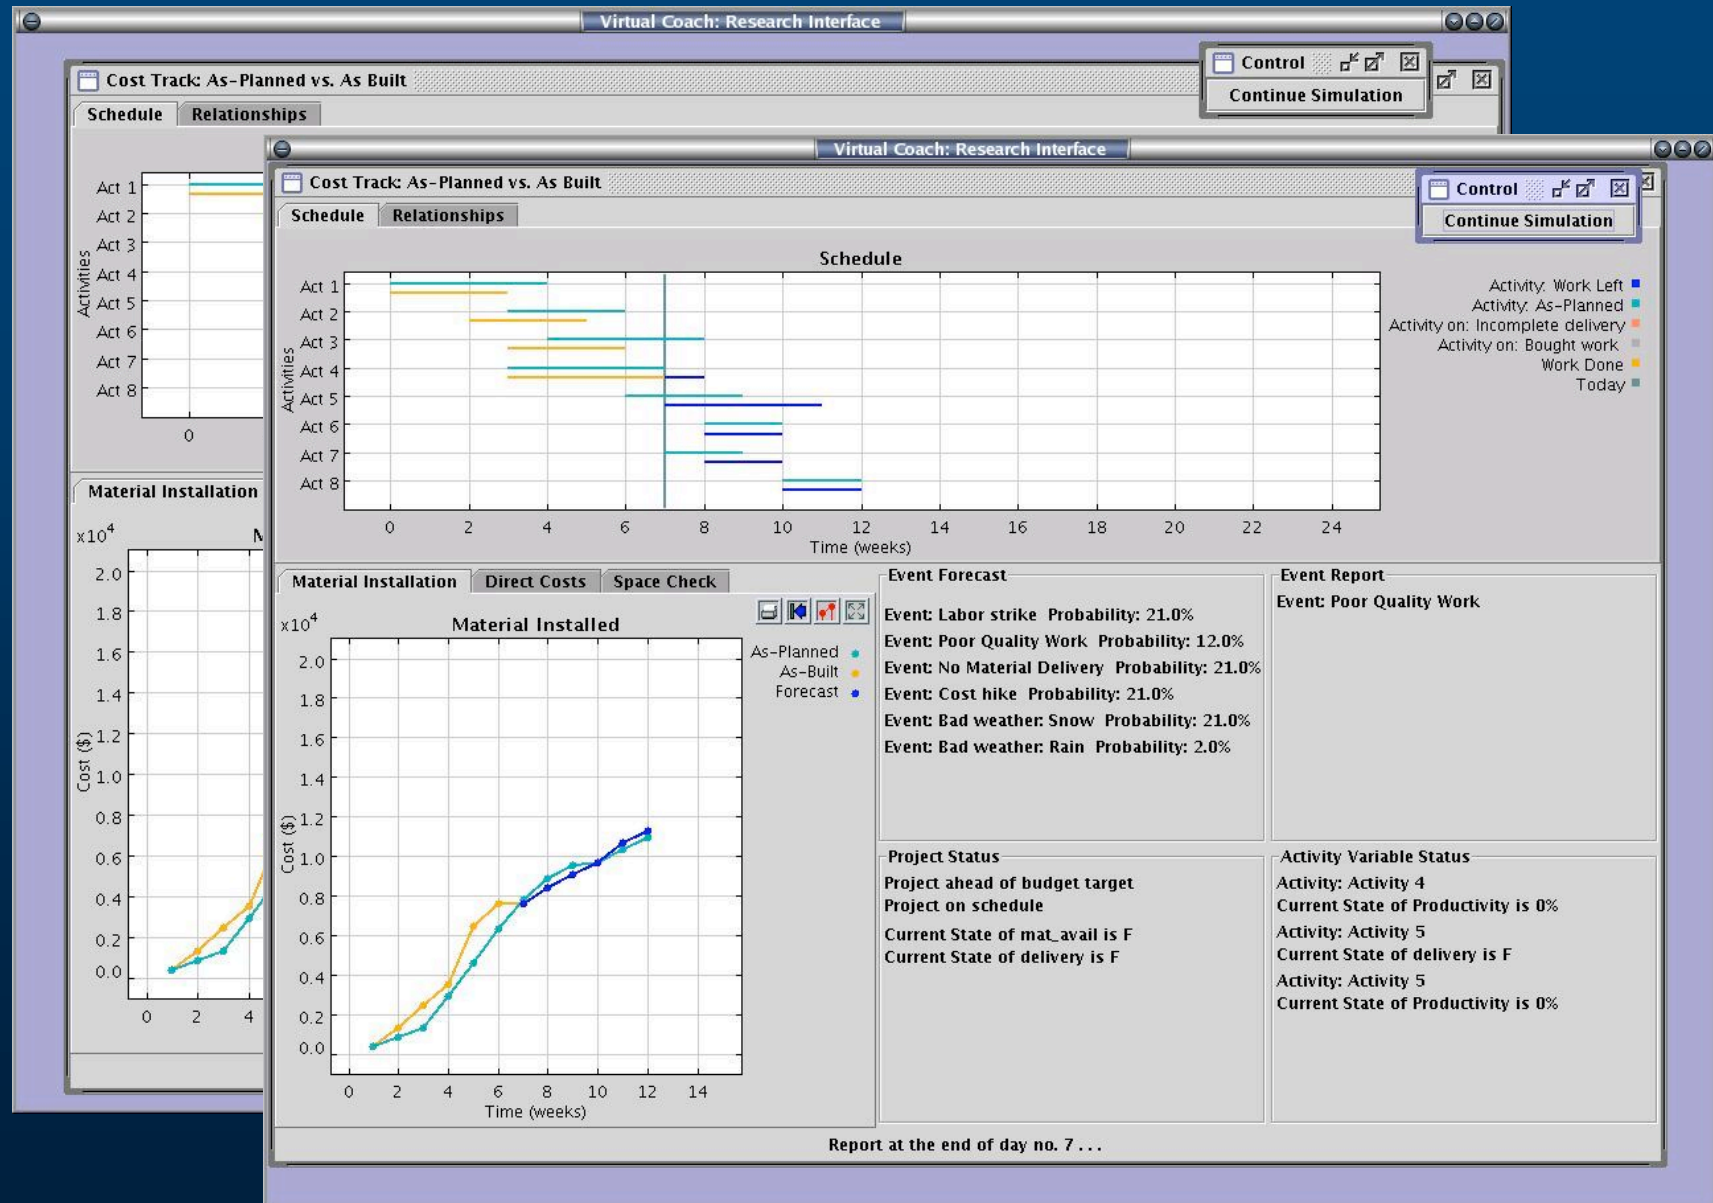

- AR Environments
- Scientific Visualization
- Interactive

Socio

Construction Management

- Desktop Situational Simulations
- Autonomous Agent Driven (Deductive Reasoning)
- System Dynamic Model
- Interactive

For Construction Managers

Novice

System Dynamics
Approach

Testing

- Tested with 19 Senior level CM students: Pre-test/ Post-test protocol
- Claim I: The environment is useful for training about the CM domain
- Claim II: Learning in the CM domain is based on an understanding of *Precedence and Resource Constraint Satisfaction*

Results

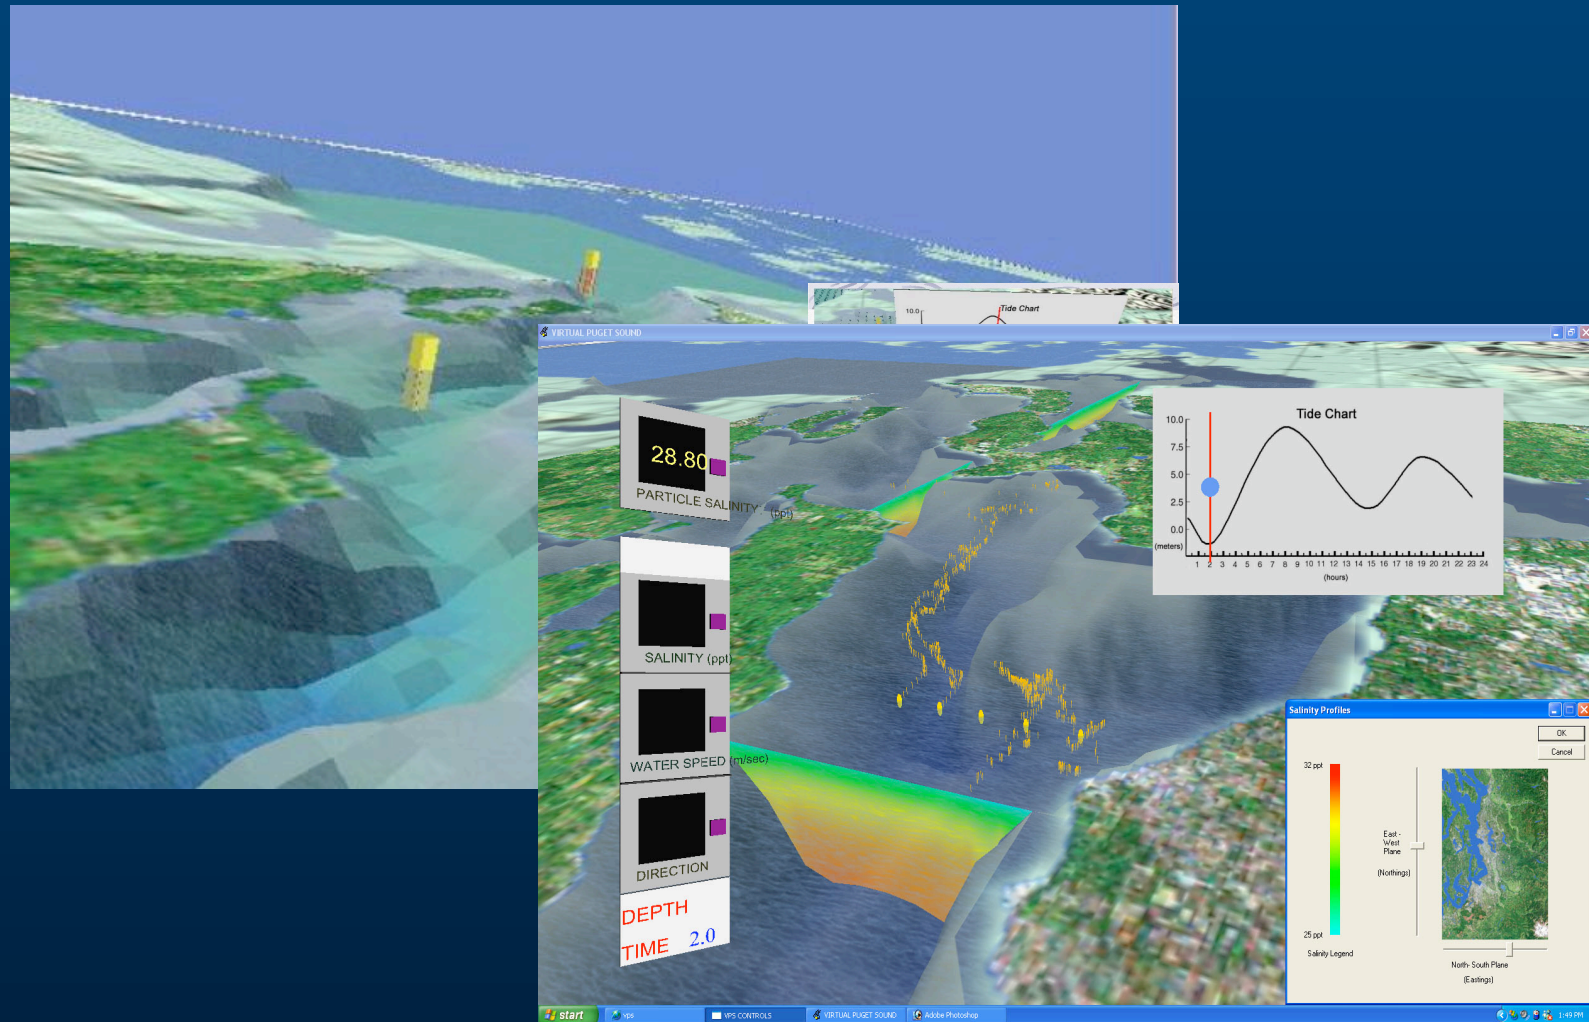

Resource Constraint Satisfaction

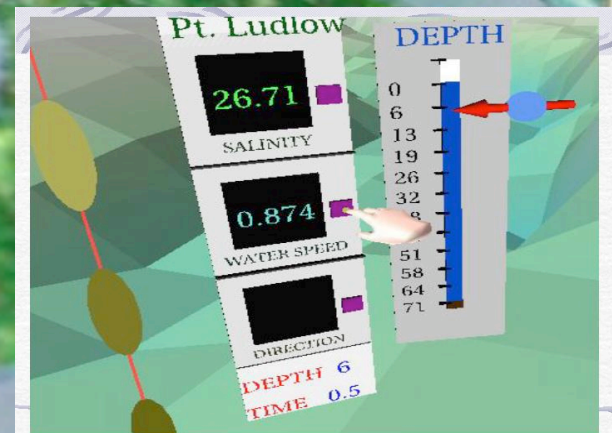

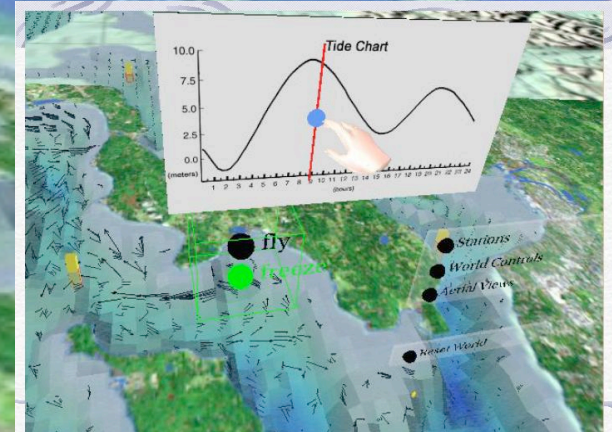

Temporal Constraint Satisfaction

Event Scheduling / Event Premonition

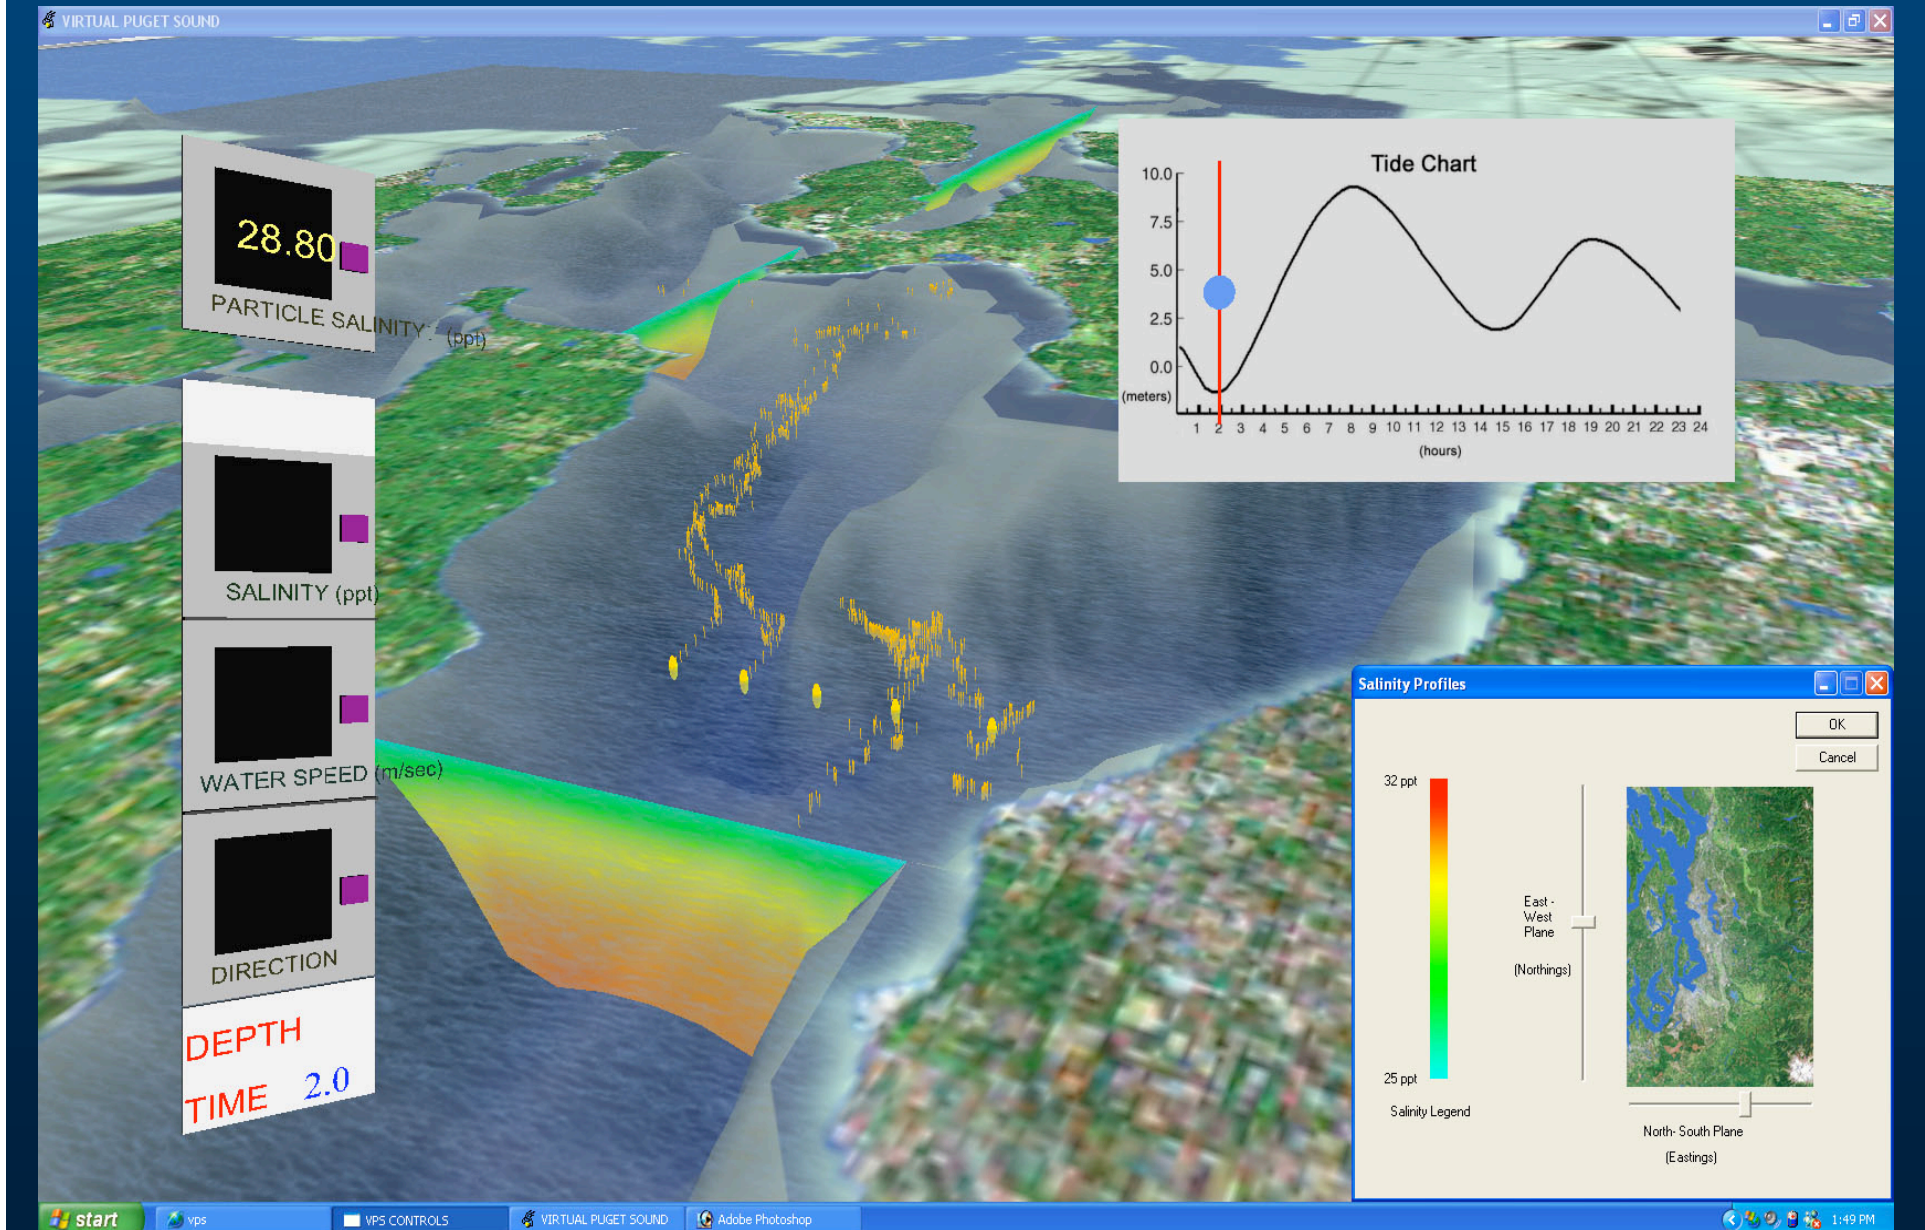

The Virtual Puget Sound
